Industrialdoors

The New Concept

The Compact Door is constructed to the highest European standards for both quality and safety.

We have designed and developed the Compact Door to meet the changing requirements of architects and industrial door users.

The Compact Door is unique in its smooth and quiet operation requiring the minimum of maintenance.

Each Compact Door is fabricated to suit its application. It is manufactured using a minimum of standard components at competitive prices.

The Compact Door fits into every building and every budget. The extra benefits are yours!

Door panels

The lightweight aluminium sandwich panels have a stucco finish with integral stainless steel hinges. They are CFC-free and give maximum insulation.

Framework

The robust door framework is self-supporting and consists of hardwearing abrasive-free rollers and tracks. Vision panels and wicket doors are standard features.

Folding system

The patented folding system uses little energy. Combined with the side tracks a long life cycle of operation is guaranteed.

Compact Door. The universal industrial door.

Drive system

The Compact Door can be supplied with 220v or 380v motors. It is also capable of silent medium speed operation.

Installation

The Compact Door is quicker and simpler to install than any other industrial door.

Space saving

The Compact folding system leaves more space available for warehousing.

Unlike a conventional overhead door, light fittings, roof fittings, overhead cranes and heaters are not obstructed.

Operational advantages

The unique guiding system minimises the forces on the moving parts. There are no counter-balancing springs or weights which may require adjustment or regular maintenance.

Integrated wicket door
